

Georgia EPD Consumer Confidence Report

In 2014 Middle Georgia College had about 800 drinking water parameters tested during the last year, by EPD approved laboratories. We are pleased to inform you that Middle Georgia College had no major violations of the water quality parameters during 2013. However we did not have any Non-Acute Microbiological Violations. In this report, you will see the water comes from, what it contains, and how it compares to the Standards set by the United States Environmental Protection Agency's Safe Drinking Water Act, and the Georgia Department of Natural Resources, Environmental Protection Division, and the Water Resources Branch. We are committed to provide clean, safe, and reliable drinking water for the whole campus. For more information about your water or this report please call Mike Crawford at 478.934.3000.

Your water comes from one groundwater well approximately 155 feet deep. The water source is from the Upper Floridian Aquifer and supplies an ample volume of water for our campus. Chlorine is used for disinfection. In 2009, the 150,000-gallon water tank was repaired, cleaned and repainted.

The Middle Georgia College Water System has one certified water plant operator – certified by the State of Georgia and the State Board of Examiners for Certification of Water and Wastewater Treatment Operators and Laboratory Analysts. I attend classes for recertification of my license. I am a member of the Georgia Rural Water Association of Georgia, and attend their conferences, and workshops.

The sources of drinking water (including both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human body activity.

Our Water Source Assessment was completed in 2010. The source specific vulnerability assessments are maintained in the EPD files in Atlanta and a copy is on file the Water Plant Office, in the Facilities Building.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1.800.426.4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their healthcare providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1.800.3426.4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. **Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.** Middle Georgia College water system is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting several hours, you can minimize the potential for lead exposure by flushing your tap for about 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in

drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://WWW.epa.gov/safewater/lead>.

Contaminants that may be present in source water include the following:

- Microbial contaminants, such as viruses, and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residual uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can, also come from gas stations, urban runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in the water provided by the public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

EPD has determined that concentration of certain water quality monitoring parameters does not change frequently within our system; therefore some of the data represented in this report are more than one year old. All tests are run by the Georgia EPD lab, in Atlanta.

Inorganic Contaminants:							
Contaminant (units)	MCL	MCL	Middle Georgia College Water System Results	Range of Detection	Sample Date	Is our water safe and meets standards?	Typical source of contaminant
Nitrate / Nitrite (ppm)	10	10	2.4	0.40	03/08/2012	Yes	Runoff from fertilizer use; leaching from septic tanks; sewage; erosion of natural deposits.

Organic Contaminants							
Contaminant (units)	MCL	MCL	Middle Georgia College Water System Results	Range of Detection	Sample Date	Is our water safe and meets standards?	Typical source of contaminant
Chlorine (ppm)	4	4	1.15	0.5 – 2.65	2011	Yes	Water additive used to control microbes

Haloacetic Acids (ppm)	60	n/a	4.14		06/12/2013	Yes	By-product of drinking water chlorination
TTHMs (Total Trihalomethanes) (ppb)	100 / 80	n/a	9.80		06/12/2013	Yes	By-product of drinking water chlorination

Lead and Copper Monitoring Results							
Parameters (units)	Action Level	MCLG	Middle Georgia College Water System Results	Range of Detection	Sample Date	Is our water safe and meets standards?	Typical source of contaminant
Copper (ppb)	AL = 1300	1300	560	1	07/31/2013	Yes	Corrosion of Household plumbing systems; erosion of natural deposits; leaching of wood preservatives
Lead (ppb)	AL = 15	15	97	1	07/31/2013	Yes; however we are under increased monitoring	Corrosion of household plumbing systems; erosion of natural deposits

Terms and Abbreviations used above:

Maximum Contaminant Level (MCL): “The highest level of contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.”

Maximum Contaminant Level Goal (MCLG): “The level of contaminant in drinking water below which there is no known or expected risk to health. MCLG allows for a margin of safety.”

Action Level (AL): “The concentration of a contaminant which, if exceeds, triggers treatment or other requirements which a water system must follow.”

Parts per Billion (ppb): One part per billion is equivalent to one minute in 2,000 years or one penny in 10 million dollars.

Parts per Million (ppm): One part per million is equivalent to one minute in 2 years or one penny in 10 thousand dollars.

n/a: not applicable: **nd:** not detectable: **ppb:** parts per billion or micrograms per liter: **ppm:** part per million or milligrams per liter: **<:** Less than
